

Python 2.7 Regular Expressions

Non-special chars match themselves. Exceptions are special characters:

```
\      Escape special char or start a sequence.
.      Match any char except newline, see re.DOTALL
^      Match start of the string, see re.MULTILINE
$      Match end of the string, see re.MULTILINE
[]     Enclose a set of matchable chars
R|S    Match either regex R or regex S.
()     Create capture group, & indicate precedence
```

After '[', enclose a set, the only special chars are:

```
]     End the set, if not the 1st char
-     A range, eg. a-c matches a, b or c
^     Negate the set only if it is the 1st char
```

Quantifiers (append '?' for non-greedy):

```
{m}      Exactly m repetitions
{m,n}    From m (default 0) to n (default infinity)
*        0 or more. Same as {,}
+        1 or more. Same as {1,}
?        0 or 1. Same as {,1}
```

Special sequences:

```
\A      Start of string
\b      Match empty string at word (\w+) boundary
\B      Match empty string not at word boundary
\d      Digit
\D      Non-digit
\s      Whitespace [ \t\n\r\f\v], see LOCALE,UNICODE
\S      Non-whitespace
\w      Alphanumeric: [0-9a-zA-Z_], see LOCALE
\W      Non-alphanumeric
\Z      End of string
\g<id>  Match prev named or numbered group,
        '<' & '>' are literal, e.g. \g<0>
        or \g<name> (not \g0 or \gname)
```

Special character escapes are much like those already escaped in Python string literals. Hence regex '\n' is same as regex '\\n':

```
\a     ASCII Bell (BEL)
\f     ASCII Formfeed
\n     ASCII Linefeed
\r     ASCII Carriage return
\t     ASCII Tab
\v     ASCII Vertical tab
\\     A single backslash
\xHH   Two digit hexadecimal character goes here
\OOO   Three digit octal char (or just use an
        initial zero, e.g. \0, \09)
\DD    Decimal number 1 to 99, match
        previous numbered group
```

Extensions. Do not cause grouping, except 'P<name>':

```
(?iLmsux)  Match empty string, sets re.X flags
(?:...)    Non-capturing version of regular parens
(?P<name>...) Create a named capturing group.
(?P=name)  Match whatever matched prev named group
(?#...)    A comment; ignored.
(?=...)    Lookahead assertion, match without consuming
(?:...)    Negative lookahead assertion
(?<=...)   Lookbehind assertion, match if preceded
(?<!...)   Negative lookbehind assertion
(?:id)y|n) Match 'y' if group 'id' matched, else 'n'
```

Flags for re.compile(), etc. Combine with '|':

```
re.I == re.IGNORECASE  Ignore case
re.L == re.LOCALE      Make \w, \b, and \s locale dependent
re.M == re.MULTILINE   Multiline
re.S == re.DOTALL      Dot matches all (including newline)
re.U == re.UNICODE     Make \w, \b, \d, and \s unicode dependent
re.X == re.VERBOSE     Verbose (unescaped whitespace in pattern
                        is ignored, and '#' marks comment lines)
```

Module level functions:

```
compile(pattern[, flags]) -> RegexObject
match(pattern, string[, flags]) -> MatchObject
search(pattern, string[, flags]) -> MatchObject
findall(pattern, string[, flags]) -> list of strings
finditer(pattern, string[, flags]) -> iter of MatchObjects
split(pattern, string[, maxsplit, flags]) -> list of strings
sub(pattern, repl, string[, count, flags]) -> string
subn(pattern, repl, string[, count, flags]) -> (string, int)
escape(string) -> string
purge() # the re cache
```

RegexObjects (returned from compile()):

```
.match(string[, pos, endpos]) -> MatchObject
.search(string[, pos, endpos]) -> MatchObject
.findall(string[, pos, endpos]) -> list of strings
.finditer(string[, pos, endpos]) -> iter of MatchObjects
.split(string[, maxsplit]) -> list of strings
.sub(repl, string[, count]) -> string
.subn(repl, string[, count]) -> (string, int)
.flags # int, Passed to compile()
.groups # int, Number of capturing groups
.groupindex # {}, Maps group names to ints
.pattern # string, Passed to compile()
```

MatchObjects (returned from match() and search()):

```
.expand(template) -> string, Backslash & group expansion
.group([group1...]) -> string or tuple of strings, 1 per arg
.groups([default]) -> tuple of all groups, non-matching=default
.groupdict([default]) -> {}, Named groups, non-matching=default
.start([group]) -> int, Start/end of substring match by group
.end([group]) -> int, Group defaults to 0, the whole match
.span([group]) -> tuple (match.start(group), match.end(group))
.pos int, Passed to search() or match()
.endpos int, "
.lastindex int, Index of last matched capturing group
.lastgroup string, Name of last matched capturing group
.re regex, As passed to search() or match()
.string string, "
```
